SERIAL-IN PARALLEL-OUT SHIFT REGISTER

DESCRIPTION — The '164 is a high speed 8-bit serial-in parallel-out shift register. Serial data is entered through a 2-input AND gate synchronous with the LOW-to-HIGH transition of the clock. The device features an asynchronous Master Reset which clears the register setting all outputs LOW independent of the clock. It utilizes the Schottky diode clamped process to achieve high speeds.

- TYPICAL SHIFT FREQUENCY OF 35 MHz
- ASYNCHRONOUS MASTER RESET
- GATED SERIAL DATA INPUT
- FULLY SYNCHRONOUS DATA TRANSFERS

ORDERING CODE: See Section 9

LOGIC SYMBOL

FUNCTIONAL DESCRIPTION — The '164 is an edge-triggered 8-bit shift register with serial data entry and an output from each of the eight stages. Data is entered serially through one of two inputs (A or B); either of these inputs can be used as an active HIGH Enable for data entry through the other input. An unused input must be tied HIGH, or both inputs connected together.

Each LOW-to-HIGH transition on the Clock (CP) input shifts data one place to the right and enters into Q_0 the logical AND of the two data inputs ($A \bullet B$) that existed before the rising clock edge. A LOW level on the Master Reset ($\overline{MR}$) input overrides all other inputs and clears the register asynchronously, forcing all Q outputs LOW.

MODE SELECT TABLE

OPERATING MODE	INPUTS			OUTPUTS	
	$\overline{MR}$	A	B	Q_0	$Q_1 - Q_7$
Reset (Clear)	L	X	X	L	L — L
Shift	H	l	l	L	$q_0 - q_6$
	H	l	h	L	$q_0 - q_6$
	H	h	l	L	$q_0 - q_6$
	H	h	h	H	$q_0 - q_6$

L (l) = LOW Voltage Levels

H (h) = HIGH Voltage Levels

X = Immaterial

q_n = Lower case letters indicate the state of the referenced input or output one setup time prior to the LOW-to-HIGH clock transition.
