

LM48822 Boomer™ Ground-Referenced, Ultra High PSRR, Ultra Low Noise, 35mW/Channel Stereo Headphone Amplifier with Common Mode Sense, and I²C Volume Control

Check for Samples: [LM48822](#), [LM48822TLEVAL](#)

FEATURES

- Ground Referenced Outputs – Eliminates Output Coupling Capacitors
- Common-Mode Sense
- Ultra-High PSRR
- I²C Volume and Mode Control
- High Output Impedance in Shutdown
- Differential Inputs
- Advanced Click-and-Pop Suppression
- Low Supply Current
- Minimum External Components
- Micro-Power Shutdown
- Available in Space-Saving 16-Bump DSBGA Package

APPLICATIONS

- Mobile Phones
- PDAs
- Notebook PCs
- Portable Electronic Devices
- MP3 Players

DESCRIPTION

The LM48822 is a single supply, ground-referenced stereo headphone amplifier designed for portable devices, such as cell phones, where board space is at a premium. The LM48822 features TI's ground-referenced architecture, which eliminates the large DC blocking capacitor required by traditional headphone amplifiers, saving board space and minimizing system cost.

The LM48822 features common-mode sensing that corrects for any differences between the amplifier ground and the potential at the headphone return terminal, minimizing noise created by any ground mismatches.

The LM48822 delivers 35mW/channel into a 16Ω load with <1% THD+N with a 3.6V supply. High power supply rejection ratio (PSRR), of 110dB at 217Hz, allows the device to operate in noisy environments without additional power supply conditioning. Flexible power supply requirements allow operation from 2.4V to 5.5V. The LM48822 has a differential inputs for improved noise rejection. High output impedance in Shutdown mode, combined with a charge pump-only mode allows the LM48822's outputs to be driven by an external source without degrading the source signal. Additionally, the LM48822 features a 64-step I²C volume control and mute function. The low power Shutdown mode reduces supply current consumption to 0.06μA.

Superior click and pop suppression eliminates audible transients on power-up/down and during shutdown. The LM48822 is available in an ultra-small 16-bump DSBGA package (2mmx2mm).

Table 1. Key Specifications

	VALUE	UNIT
Output Power/channel at V _{DD} = 3.6V R _L = 16Ω, THD+N ≤ 1%	35	mW (typ)
Output Power/channel at V _{DD} = 3.6V R _L = 32Ω, THD+N ≤ 1%	40	mW (typ)
Quiescent Power Supply Current at 3.6V	3.5	mA (typ)
PSRR at 217Hz	110	dB (typ)
Shutdown current	0.06	μA (typ)

APPLICATION INFORMATION

I²C COMPATIBLE INTERFACE

The LM48822 is controlled through an I²C compatible serial interface that consists of a serial data line (SDA) and a serial clock (SCL). The clock line is uni-directional. The data line is bi-directional (open collector). The LM48822 and the master can communicate at clock rates up to 400kHz. Figure 21 shows the I²C interface timing diagram. Data on the SDA line must be stable during the HIGH period of SCL. The LM48822 is a transmit/receive slave-only device, reliant upon the master to generate the SCL signal. Each transmission sequence is framed by a START condition and a STOP condition Figure 22. Each data word, device address and data, transmitted over the bus is 8 bits long as is always followed by an acknowledge pulse (Figure 23). The LM48822 device address is 1100000.

I²C BUS FORMAT

The I²C bus format is shown in Figure 23. The START signal, the transition of SDA from HIGH to LOW while SDA is HIGH, is generated, altering all devices on the bus that a device address is being written to the bus.

The 7-bit device address is written to the bus, most significant bit (MSB) first, followed by the $\overline{R/W}$ bit. $\overline{R/W} = 0$ indicates the master is writing to the slave device, $\overline{R/W} = 1$ indicates the master wants to read data from the slave device. The LM48822 is a WRITE-ONLY device and will not respond the $\overline{R/W} = 1$. The data is latched in on the rising edge of the clock. Each address bit must be stable while SDA is HIGH. After the last address bit is transmitted, the master device releases SDA, during which time, an acknowledge clock pulse is generated by the slave device. If the LM48822 receives the correct address, the device pulls the SDA line low, generating an acknowledge bit (ACK).

Once the master device registers the ACK bit, the 8-bit register data word is sent. Each data bit should be stable while SCL is HIGH. After the 8-bit register data word is sent, the LM48822 sends another ACK bit. Following the acknowledgement of the register data word, the master issues a STOP bit, allowing SDA to go high while SDA is high.

GENERAL AMPLIFIER FUNCTION

The LM48822 headphone amplifier feature TI's ground referenced architecture that eliminates the large DC-blocking capacitors required at the outputs of traditional headphone amplifiers. A low-noise inverting charge pump creates a negative supply (CPV_{SS}) from the positive supply voltage (V_{DD}). The headphone amplifiers operate from these bipolar supplies, with the amplifier outputs biased about GND, instead of a nominal DC voltage (typically $V_{DD}/2$), like traditional amplifiers. Because there is no DC component to the headphone output signals, the large DC-blocking capacitors (typically 220 μ F) are not necessary, conserving board space and system cost, while improving frequency response.

GENERAL AMPLIFIER EXPLANATION

The LM48822 features a differential input stage, which offers improved noise rejection compared to a single-ended input amplifier. Because a differential input amplifier amplifies the difference between the two input signals, any component common to both signals is cancelled. An additional benefit of the differential input structure is the possible elimination of the DC input blocking capacitors. Since the DC component is common to both inputs, and thus cancelled by the amplifier, the LM48822 can be used without input coupling capacitors when configured with a differential input signal.

CHARGE PUMP ONLY MODE

In applications where the headphone jack is used as both an output and input port, signals such as a microphone input can appear on the headphone amplifier output. Traditional charge pump headphone amplifiers can clamp or distort the signals that appear on their output. Without the charge pump active, generating the negative voltage supply, the internal protection diodes of the amplifier clamp the incoming signal, distorting the negative half cycle, see [Figure 24](#). The LM48822 charge pump only mode eliminates this problem. In charge pump only mode, the amplifiers are disabled, while the charge pump remains active. The disabled amplifier outputs present a high impedance (1M Ω) load to the incoming signal. The charge pump maintains the negative rail, allowing the incoming signal to swing between V_{DD} and V_{SS} without any interference from the device.

Set bit B4 (CP_ONLY) of the MODE CONTROL register to 1 for charge pump only mode. Setting CP_ONLY = 1 disables both the left and right channels, regardless of the status of the shutdown control bits. Set CP_ONLY = 0 for normal operation.

Figure 24. Back-Driving the LM48822 Outputs

COMMON MODE SENSE

The LM48822 features a ground (common mode) sensing feature. In noisy applications, or where the headphone jack is used as a line out to other devices, noise pick up and ground imbalance can degrade audio quality. The LM48822 COM input senses and corrects any noise at the headphone return, or any ground imbalance between the headphone return and device ground, improving audio reproduction. Connect COM directly to the headphone return terminal of the headphone jack [Figure 25](#). No additional external components are required. Connect COM to GND if the common-mode sense feature is not in use.

SHUTDOWN FUNCTION

The LM48822 features three shutdown controls. Bits B6 (SDL) and B1 (SDR) of the MODE CONTROL register control the left and right channels, respectively. Set the control bits to 1 to disable the corresponding channel. When SDR = 1 and SDL = 0, the right channel is disabled, the right and left inputs are summed and output as a mono signal on the OUTL. When SDL = 1 and SDR = 0, the left channel is disabled, while only the right input signal is output on OUTR. Setting both SDL and SDR = 1 disables both channels, while the charge pump remains active. Bit B6 (SHDN) of the VOLUME CONTROL register is the global shutdown control for the entire device. Set SHDN = 1 to disable the entire device; both amplifiers and charge pump are disabled. Set SHDN = 0 for normal operation. SHDN = 1 overrides any other shutdown control bit.

MUTE FUNCTION

Set bits B2 (MUTE_LEFT) and B0 (MUTE_RIGHT) of the MODE CONTROL register to 1 to mute the respective channels. Set MUTE_LEFT and MUTE_RIGHT to 0 for normal operation.

SD_BIAS FUNCTION

The LM48822 BIAS is controlled through the I²C interface. Set bit B5 (SD_BIAS) of the MODE CONTROL register to 1 to enable the LM48822 BIAS. BIAS provides the voltage for both the amplifiers and the charge pump. When enabled, V_{BIAS} will track V_{DD} for V_{DD} < 3V. Once V_{DD} exceeds 3V, V_{BIAS} remains fixed at 3V, limiting the output swing of the device the 6V_{P-P}. Set SD_BIAS = 0 to disable BIAS. Disabling BIAS allows the amplifier and charge pump to track V_{DD}, increasing output swing; however, a slight degradation in PSSR will occur. Limit V_{DD} to 4.2V or less when BIAS is disabled.

PROPER SELECTION OF EXTERNAL COMPONENTS

Power Supply Bypassing/Filtering

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the supply pins as possible. Place a 1μF ceramic capacitors from V_{DD} to GND. Additional bulk capacitance may be added as required.

Charge Pump Capacitor Selection

Use low ESR ceramic capacitors (less than 100mΩ) for optimum performance.

Charge Pump Flying Capacitor (C1)

The flying capacitor (C1) affects the load regulation and output impedance of the charge pump. A C1 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C1 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2μF, the R_{DS(ON)} of the charge pump switches and the ESR of C1 and C2 dominate the output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Charge Pump Flying Capacitor (C2)

The value and ESR of the hold capacitor (C2) directly affects the ripple on CPV_{SS}. Increasing the value of C2 reduces output ripple. Decreasing the ESR of C2 reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Input Capacitor Selection

Input capacitors may be required for some applications, or when the audio source is single-ended. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM48822. The input capacitors create a high-pass filter with the input resistors R_{IN}. The -3dB point of the high pass filter is found using [Equation 1](#) below.

$$f = 1 / 2\pi R_{IN} C_{IN} \quad (\text{Hz}) \quad (1)$$

where:

the value of R_{IN} is given in the [Electrical Characteristics](#) Table.

High pass filtering the audio signal helps protect the speakers. When the LM48822 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

SINGLE-ENDED AUDIO AMPLIFIER CONFIGURATION

The LM48822 is compatible with single-ended sources. [Figure 26](#) shows the typical single-ended applications circuit.

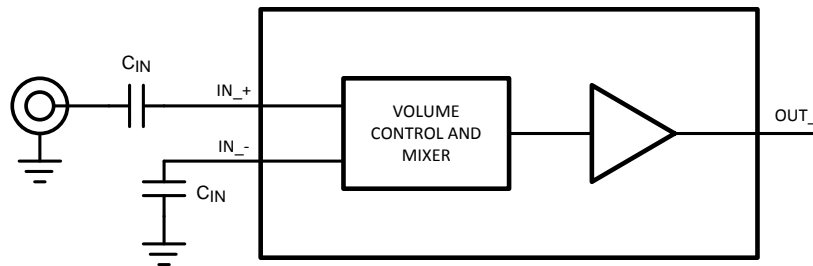

Figure 26. Single-Ended Input Configuration

PCB LAYOUT CONFIGURATION

Minimize trace impedance of the power, ground and all output traces for optimum performance. Voltage loss due to trace resistance between the LM48822 and the load results in decreased output power and efficiency. Trace resistance between the power supply and ground has the same effect as a poorly regulated supply, increased ripple and reduced peak output power. Use wide traces for power supply inputs and amplifier outputs to minimize losses due to trace resistance, as well as route heat away from the device. Proper grounding improves audio performance, minimizes crosstalk between channels and prevents switching noise from interfering with the audio signal. Use of power and ground planes is recommended.

Place all digital components and route digital signal traces as far as possible from analog components and traces. Do not run digital and analog traces in parallel on the same PCB layer. If digital and analog signal lines must cross either over or under each other, ensure that they cross in a perpendicular fashion.

Table 6. LM48822TL Demoboard Bill of Materials

Designator	Quantity	Description
C1	1	10 μ F \pm 10% 16V 500 Ω Tantalum Capacitor (B Case) AVX TPSB106K016R0500
C2	1	1 μ F \pm 10% 16V X5R Ceramic Capacitor (603) Panasonic ECJ-1VB1C105K
C3, C8, C9	3	2.2 μ F \pm 10% 10V X5R Ceramic Capacitor (603) Panasonic ECJ-1VB1A225K
C4 — C7	4	1 μ F \pm 10% 16V X7R Ceramic Capacitor (1206) Panasonic ECJ-3YB1C105K
R1, R2	2	5k Ω \pm 5% 1/10W Thick Film Resistor (603) Vishay CRCW06035R1KJNEA
J1	1	Stereo Headphone Jack
J2	1	16-Pin Boardmount Socket 3M 8516-4500JL
JU1	1	3 Pin Header
JU2	1	2 Pin Header
LM48822TL	1	LM48822TL (16-Bump DSBGA)

Revision History

Rev	Date	Description
0.1	04/15/08	Initial PDF.
0.2	04/23/08	Added the demo boards and schematic.
0.3	04/30/08	Text edits.
0.4	07/10/08	Text edits.
0.5	03/09/11	Changed the bit B7 into B6 under the SHUTDOWN FUNCTION section.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
LM48822TL/NOPB	ACTIVE	DSBGA	YZR	16	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	GK1	Samples
LM48822TLX/NOPB	ACTIVE	DSBGA	YZR	16	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	GK1	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

YZR0016

D: Max = 2.01 mm, Min = 1.91 mm

E: Max = 2.01 mm, Min = 1.91 mm

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
