

# Ultra-low Jitter LVCMOS Fanout Buffer/Level Translator with Universal Input

Check for Samples: [LMK00105](#)

## FEATURES

- 5 LVCMOS Outputs, DC to 200 MHz
- Universal Input
  - LVPECL
  - LVDS
  - HCSL
  - SSTL
  - LVCMOS / LVTTTL
- Crystal Oscillator Interface
  - Crystal Input Frequency: 10 to 40 MHz
- Output Skew: 6 ps
- Additive Phase Jitter
  - 30 fs at 156.25 MHz (12 kHz to 20 MHz)
- Low Propagation Delay
- Operates with 3.3 or 2.5 V Core Supply Voltage
- Adjustable Output Power Supply
  - 1.5 V, 1.8 V, 2.5 V, and 3.3 V For Each Bank
- 24 pin QFN package (4.0 x 4.0 x 0.8 mm)

## TARGET APPLICATIONS

- LO Reference Distribution for RRU Applications
- SONET, Ethernet, Fibre Channel Line Cards
- Optical Transport Networks
- GPON OLT/ONU
- Server and Storage Area Networking
- Medical Imaging
- Portable Test and Measurement
- High-end A/V

## DESCRIPTION

The LMK00105 is a high performance, low noise LVCMOS fanout buffer which can distribute 5 ultra-low jitter clocks from a differential, single ended, or crystal input. The LMK00105 supports synchronous output enable for glitch free operation. The ultra low-skew, low-jitter, and high PSRR make this buffer ideally suited for various networking, telecom, server and storage area networking, RRU LO reference distribution, medical and test equipment applications.

The core voltage can be set to 2.5 or 3.3 V, while the output voltage can be set to 1.5, 1.8, 2.5 or 3.3 V. The LMK00105 can be easily configured through pin programming.

## FUNCTIONAL BLOCK DIAGRAM

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## Pin Functions

**Table 1. Pin Descriptions**

Pin #	Pin Name	Type	Description
DAP	DAP	-	The DAP should be grounded
2, 6	Vddo	Power	Power Supply for Bank A (CLKout0 and CLKout 1) CLKout pins.
3	CLKout0	Output	LVC MOS Output
1,4,7,11, 12, 16,19	GND	GND	Ground
5	CLKout1	Output	LVC MOS Output
8,23	Vdd	Power	Supply for operating core and input buffer
9	OSCin	Input	Input for Crystal
10	OSCout	Output	Output for Crystal
13	CLKout2	Output	LVC MOS Output
14,18	Vddo	Power	Power Supply for Bank B (CLKout2 to CLKout 4) CLKout pins
15	CLKout3	Output	LVC MOS Output
17	CLKout4	Output	LVC MOS Output
20	CLKin*	Input	Optional complimentary input pin
21	CLKin	Input	Input Pin
22	SEL	Input	Input Clock Selection. This pin has an internal pull-down resistor. <sup>(1)</sup>
24	OE	Input	Output Enable. This pin has an internal pull-down resistor. <sup>(1)</sup>

(1) CMOS control input with internal pull-down resistor.

## Absolute Maximum Ratings <sup>(1) (2)</sup>

Parameter	Symbol	Ratings	Units
Core Supply Voltage	V <sub>dd</sub>	-0.3 to 3.6	V
Output Supply Voltage	V <sub>ddo</sub>	-0.3 to 3.6	V
Input Voltage	V <sub>IN</sub>	-0.3 to V <sub>dd</sub> + 0.3	V
Storage Temperature Range	T <sub>STG</sub>	-65 to 150	°C
Lead Temperature (solder 4 s)	T <sub>L</sub>	+260	°C
Junction Temperature	T <sub>J</sub>	+125	°C

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.
- (2) This device is a high performance integrated circuit with ESD handling precautions. Handling of this device should only be done at ESD protected work stations. The device is rated to a HBM-ESD of > 2.5 kV, a MM-ESD of > 250 V, and a CDM-ESD of > 1 kV.

## Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Units
Ambient Temperature	T <sub>A</sub>	-40	25	85	°C
Core Supply Voltage	V <sub>dd</sub>	2.375	3.3	3.45	V
Output Supply Voltage <sup>(1)</sup>	V <sub>ddo</sub>	1.425	3.3	V <sub>dd</sub>	V

- (1) V<sub>ddo</sub> should be less than or equal to V<sub>dd</sub> (V<sub>ddo</sub> ≤ V<sub>dd</sub>)

## Package Thermal Resistance

**Table 2. 24-Lead LLP**

Package	Symbols	Ratings	Units
Thermal resistance from junction to ambient on 4-layer Jecdec board <sup>(1)</sup>	θ <sub>JA</sub>	50.6	°C/W
Thermal resistance from junction to case <sup>(2)</sup>	θ <sub>JC</sub> (DAP)	20.1	°C/W

- (1) Specification assumes 4 thermal vias connect to die attach pad to the embedded copper plane on the 4-layer Jecdec board. These vias play a key role in improving the thermal performance of the LLP. For best thermal dissipation it is recommended that the maximum number of vias be used on the board layout.
- (2) Case is defined as the DAP (die attach pad).

## Electrical Characteristics

( $2.375\text{ V} \leq V_{dd} \leq 3.45\text{ V}$ ,  $1.425 \leq V_{ddo} \leq V_{dd}$ ,  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , Differential inputs. Typical values represent most likely parametric norms at  $V_{dd} = V_{ddo} = 3.3\text{ V}$ ,  $T_A = 25\text{ }^{\circ}\text{C}$ , at the Recommended Operation Conditions at the time of product characterization and are **not** guaranteed). Test conditions are:  $F_{\text{test}} = 100\text{ MHz}$ , Load =  $5\text{ pF}$  in parallel with  $50\text{ }\Omega$  unless otherwise stated.

## MEASUREMENT DEFINITIONS

### Differential Voltage Measurement Terminology

The differential voltage of a differential signal can be described by two different definitions causing confusion when reading datasheets or communicating with other engineers. This section will address the measurement and description of a differential signal so that the reader will be able to understand and discern between the two different definitions when used.

The first definition used to describe a differential signal is the absolute value of the voltage potential between the inverting and non-inverting signal. The symbol for this first measurement is typically  $V_{ID}$  or  $V_{OD}$  depending on if an input or output voltage is being described.

The second definition used to describe a differential signal is to measure the potential of the non-inverting signal with respect to the inverting signal. The symbol for this second measurement is  $V_{SS}$  and is a calculated parameter. Nowhere in the IC does this signal exist with respect to ground, it only exists in reference to its differential pair.  $V_{SS}$  can be measured directly by oscilloscopes with floating references, otherwise this value can be calculated as twice the value of  $V_{OD}$  as described in the first section

Figure 6 illustrates the two different definitions side-by-side for inputs and Figure 7 illustrates the two different definitions side-by-side for outputs. The  $V_{ID}$  and  $V_{OD}$  definitions show  $V_A$  and  $V_B$  DC levels that the non-inverting and inverting signals toggle between with respect to ground.  $V_{SS}$  input and output definitions show that if the inverting signal is considered the voltage potential reference, the non-inverting signal voltage potential is now increasing and decreasing above and below the non-inverting reference. Thus the peak-to-peak voltage of the differential signal can be measured.

$V_{ID}$  and  $V_{OD}$  are often defined in volts (V) and  $V_{SS}$  is often defined as volts peak-to-peak ( $V_{PP}$ ).

Figure 6. Two Different Definitions for Differential Input Signals

Figure 7. Two Different Definitions for Differential Output Signals

## FUNCTIONAL DESCRIPTION

The LMK00105 is a 5 output LVCMOS clock fanout buffer with low additive jitter that can operate up to 200 MHz. It features a 2:1 input multiplexer with a crystal oscillator input, single supply or dual supply (lower power) operation, and pin-programmable device configuration. The device is offered in a 24-pin LLP package.

### $V_{dd}$ and $V_{ddo}$ Power Supplies

Separate core and output supplies allow the output buffers to operate at the same supply as the  $V_{dd}$  core supply (3.3 V or 2.5 V) or from a lower supply voltage (3.3 V, 2.5 V, 1.8 V, or 1.5 V). Compared to single-supply operation, dual supply operation enables lower power consumption and output-level compatibility.

Bank A (CLKout0 and CLKout1) and Bank B (CLKout2 to CLKout4) may also be operated at different  $V_{ddo}$  voltages, provided neither  $V_{ddo}$  voltage exceeds  $V_{dd}$ . <sup>(1) (2)</sup>

### CLOCK INPUT

The LMK00105 has one differential input, CLKin/CLKin\* and OSCin, that can be driven in different manners that are described in the following sections.

#### SELECTION OF CLOCK INPUT

Clock input selection is controlled using the SEL pin as shown in [Table 3](#). Refer to [Driving the Clock Inputs](#) for clock input requirements. When CLKin is selected, the crystal circuit is powered down. When OSCin is selected, the crystal oscillator will start-up and its clock will be distributed to all outputs. Refer to [Crystal Interface](#) for more information. Alternatively, OSCin may be driven by a single ended clock, up to 200 MHz, instead of a crystal.

- (1) Care should be taken to ensure the  $V_{ddo}$  voltage does not exceed the  $V_{dd}$  voltage to prevent turning-on the internal ESD protection circuitry.
- (2) **DO NOT DISCONNECT OR GROUND ANY OF THE  $V_{ddo}$  PINS** as the  $V_{ddo}$  pins are internally connected within an output bank.

**Table 3. Input Selection**

SEL	Input
0	CLKin, CLKin*
1	OSCin (Crystal Mode)

#### CLKin/CLKin\* Pins

The LMK00105 has a differential input (CLKin/CLKin\*) which can be driven single-ended or differentially. It can accept AC or DC coupled 3.3V/2.5V LVPECL, LVDS, or other differential and single ended signals that meet the input requirements in [Electrical Characteristics](#). <sup>(1)</sup> Refer to [Driving the Clock Inputs](#) for more details on driving the LMK00105 inputs.

In the event that a Crystal mode is not selected and the CLKin pins do not have an AC signal applied to them, [Table 4](#) following will be the state of the outputs.

**Table 4. CLKin Input vs. Output States**

CLKin	Output State
Open	Logic Low
Logic Low	Logic Low
Logic High	Logic High

- (1) When using differential signals with  $V_{CM}$  outside of the acceptable range for the specified  $V_{ID}$ , the clock must be AC coupled.

### OSCin/OSCout Pins

The LMK00105 has a crystal oscillator which will be powered up when OSCin is selected. Alternatively, OSCin may be driven by a single ended clock, up to 200 MHz, instead of a crystal. Refer to [Crystal Interface](#) for more information. If Crystal mode is selected and the pins do not have an AC signal applied to them, [Table 5](#) will be the state of the outputs. If Crystal mode is selected an open state is not allowed on OSCin, as the outputs may oscillate due to the crystal oscillator circuitry.

**Table 5. CLKin Input vs. Output States**

OSCin	Output State
Open	Not Allowed
Logic Low	Logic High
Logic High	Logic Low

### CLOCK OUTPUTS

The LMK00105 has 5 LVCMOS outputs.

#### Output Enable Pin

When the output enable pin is held High, the outputs are enabled. When it is held Low, the outputs are held in a Low state as shown in [Table 6](#).

**Table 6. Output Enable Pin States**

OE	Outputs
Low	Disabled (Hi-Z)
High	Enabled

The OE pin is synchronized to the input clock to ensure that there are no runt pulses. When OE is changed from Low to High, the outputs will initially have an impedance of about 400  $\Omega$  to ground until the second falling edge of the input clock and starting with the second falling edge of the input clock, the outputs will buffer the input. If the OE pin is taken from Low to High when there is no input clock present, the outputs will either go high or low and stay at that state; they will not oscillate. When the OE pin is taken from High to Low the outputs will be Low after the second falling edge of the clock input and then will go to a Disabled (Hi-Z) state starting after the next rising edge.

### Using Less than Five Outputs

Although the LMK00105 has 5 outputs, not all applications will require all of these. In this case, the unused outputs should be left floating with a minimum copper length to minimize capacitance. In this way, this output will consume minimal output current because it has no load. <sup>(1)</sup>

- (1) For best soldering practices, the minimum trace length should extend to include the pin solder mask. This way during reflow, the solder has the same copper area as connected pins. This allows for good, uniform fillet solder joints helping to keep the IC level during reflow.

## APPLICATION INFORMATION

### Driving the Clock Inputs

The LMK00105 has a differential input (CLKin/CLKin\*) that can accept AC or DC coupled 3.3V/2.5V LVPECL, LVDS, and other differential and single ended signals that meet the input requirements specified in [Electrical Characteristics](#). The device can accept a wide range of signals due to its wide input common mode voltage range ( $V_{CM}$ ) and input voltage swing ( $V_{ID}$ )/dynamic range. AC coupling may also be employed to shift the input signal to within the  $V_{CM}$  range.

To achieve the best possible phase noise and jitter performance, it is mandatory for the input to have a high slew rate of 2 V/ns (differential) or higher. Driving the input with a lower slew rate will degrade the noise floor and jitter. For this reason, a differential input signal is recommended over single-ended because it typically provides higher slew rate and common-mode noise rejection.

While it is recommended to drive CLKin with a differential signal input, it is possible to drive them with a single ended clock. The single-ended input slew rate should be as high as possible to minimize performance degradation. The CLKin input has an internal bias voltage of about 1.4 V, so the input can be AC coupled as shown in [Figure 8](#), [Figure 9](#), or [Figure 10](#) depending upon the application.

**Figure 8. Preferred Configuration: Single-Ended LVCMOS Input, AC Coupling**

**Figure 9. Single-Ended LVCMOS Input, AC Coupling Near End Termination**

**Figure 10. Single-Ended LVCMOS Input, AC Coupling, Far End Termination**

A single ended clock may also be DC coupled to CLKIn as shown in Figure 11. If the DC coupled input swing has a common mode level near the devices internal bias of 1.4 V, then only a 0.1  $\mu$ F bypass cap is required on CLKIn\*. Otherwise, if the input swing is not optimally centered near the internal bias voltage, then CLKIn\* should be externally biased to the midpoint voltage of the input swing. This can be achieved using external biasing resistors,  $R_{B1}$  and  $R_{B2}$ , or another low-noise voltage reference. The external bias voltage should be within the specified input common voltage (VCM) range. This will ensure the input swing crosses the threshold voltage at a point where the input slew rate is the highest.

Figure 11. Single-Ended LVCMOS Input, DC Coupling with Common Mode Biasing

If the crystal oscillator circuit is not used, it is possible to drive the OSCin input with a single-ended external clock as shown in Figure 12. Configurations similar to Figure 9 or Figure 10 could also be used as long as the OSCout pin is left floating. The input clock should be AC coupled to the OSCin pin, which has an internally generated input bias voltage, and the OSCout pin should be left floating. While OSCin provides an alternative input to multiplex an external clock, it is recommended to use either differential input (CLKIn) since it offers higher operating frequency, better common mode, improved power supply noise rejection, and greater performance over supply voltage and temperature variations.

Figure 12. Driving OSCin with a Single-Ended

## Crystal Interface

The LMK00105 has an integrated crystal oscillator circuit that supports a fundamental mode, AT-cut crystal. The crystal interface is shown in [Figure 13](#).

**Figure 13. Crystal Interface**

The load capacitance ( $C_L$ ) is specific to the crystal, but usually on the order of 18 to 20 pF. While  $C_L$  is specified for the crystal, the OSCin input capacitance ( $C_{IN} = 1$  pF typical) of the device and PCB stray capacitance ( $C_{STRAY} \sim 1$  to 3 pF) can affect the discrete load capacitor values,  $C_1$  and  $C_2$ . For the parallel resonant circuit, the discrete capacitor values can be calculated as follows:

$$C_L = (C_1 * C_2) / (C_1 + C_2) + C_{IN} + C_{STRAY} \quad (1)$$

Typically,  $C_1 = C_2$  for optimum symmetry, so [Equation 1](#) can be rewritten in terms of  $C_1$  only:

$$C_L = C_1^2 / (2 * C_1) + C_{IN} + C_{STRAY} \quad (2)$$

Finally, solve for  $C_1$ :

$$C_1 = (C_L - C_{IN} - C_{STRAY}) * 2 \quad (3)$$

[Electrical Characteristics](#) provides crystal interface specifications with conditions that ensure start-up of the crystal, but it does not specify crystal power dissipation. The designer will need to ensure the crystal power dissipation does not exceed the maximum drive level specified by the crystal manufacturer. Overdriving the crystal can cause premature aging, frequency shift, and eventual failure. Drive level should be held at a sufficient level necessary to start-up and maintain steady-state operation.

The power dissipated in the crystal,  $P_{XTAL}$ , can be computed by:

$$P_{XTAL} = I_{RMS}^2 * R_{ESR} * (1 + C_0 / C_L)^2 \quad (4)$$

Where:

- $I_{RMS}$  is the RMS current through the crystal.
- $R_{ESR}$  is the maximum equivalent series resistance specified for the crystal.
- $C_L$  is the load capacitance specified for the crystal.
- $C_0$  is the minimum shunt capacitance specified for the crystal.

$I_{RMS}$  can be measured using a current probe (e.g. Tektronix CT-6 or equivalent) placed on the leg of the crystal connected to OSCout with the oscillation circuit active.

As shown in [Figure 13](#), an external resistor,  $R_{LIM}$ , can be used to limit the crystal drive level if necessary. If the power dissipated in the selected crystal is higher than the drive level specified for the crystal with  $R_{LIM}$  shorted, then a larger resistor value is mandatory to avoid overdriving the crystal. However, if the power dissipated in the crystal is less than the drive level with  $R_{LIM}$  shorted, then a zero value for  $R_{LIM}$  can be used. As a starting point, a suggested value for  $R_{LIM}$  is 1.5 kΩ.

## Power Supply Ripple Rejection

In practical system applications, power supply noise (ripple) can be generated from switching power supplies, digital ASICs or FPGAs, etc. While power supply bypassing will help filter out some of this noise, it is important to understand the effect of power supply ripple on the device performance. When a single-tone sinusoidal signal is applied to the power supply of a clock distribution device, such as LMK00105, it can produce narrow-band phase modulation as well as amplitude modulation on the clock output (carrier). In the singleside band phase noise spectrum, the ripple-induced phase modulation appears as a phase spur level relative to the carrier (measured in dBc).

For the LMK00105, power supply ripple rejection (PSRR), was measured as the single-sideband phase spur level (in dBc) modulated onto the clock output when a ripple signal was injected onto the  $V_{ddo}$  supply. The PSRR test setup is shown in Figure 14.

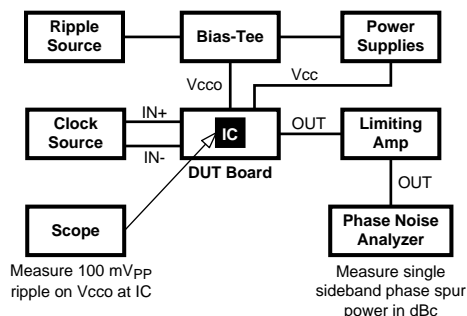

Figure 14. PSRR Test Setup

A signal generator was used to inject a sinusoidal signal onto the  $V_{ddo}$  supply of the DUT board, and the peak-to-peak ripple amplitude was measured at the  $V_{ddo}$  pins of the device. A limiting amplifier was used to remove amplitude modulation on the differential output clock and convert it to a single-ended signal for the phase noise analyzer. The phase spur level measurements were taken for clock frequencies of 100 MHz under the following power supply ripple conditions:

- Ripple amplitude: 100 mVpp on  $V_{ddo} = 2.5$  V
- Ripple frequency: 100 kHz

Assuming no amplitude modulation effects and small index modulation, the peak-to-peak deterministic jitter (DJ) can be calculated using the measured single-sideband phase spur level (PSRR) as follows:

$$DJ \text{ (ps pk-pk)} = [(2 * 10^{(PSRR/20)}) / (\pi * f_{clk})] * 10^{12} \quad (5)$$

## Power Supply Bypassing

The  $V_{dd}$  and  $V_{ddo}$  power supplies should have a high frequency bypass capacitor, such as 100 pF, placed very close to each supply pin. Placing the bypass capacitors on the same layer as the LMK00105 improves input sensitivity and performance. All bypass and decoupling capacitors should have short connections to the supply and ground plane through a short trace or via to minimize series inductance.

## Thermal Management

For reliability and performance reasons the die temperature should be limited to a maximum of 125°C. That is, as an estimate,  $T_A$  (ambient temperature) plus device power consumption times  $\theta_{JA}$  should not exceed 125°C.

The package of the device has an exposed pad that provides the primary heat removal path as well as excellent electrical grounding to a printed circuit board. To maximize the removal of heat from the package a thermal land pattern including multiple vias to a ground plane must be incorporated on the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package.

A recommended land and via pattern is shown in Figure 15. More information on soldering LLP packages and gerber footprints can be obtained: <http://www.national.com/en/packaging/index.html>.

A recommended footprint including recommended solder mask and solder paste layers can be found at: <http://www.national.com/en/packaging/gerber.html> for the SQA24A package.

To minimize junction temperature it is recommended that a simple heat sink be built into the PCB (if the ground plane layer is not exposed). This is done by including a copper area of about 2 square inches on the opposite side of the PCB from the device. This copper area may be plated or solder coated to prevent corrosion but should not have conformal coating (if possible), which could provide thermal insulation. The vias shown in Figure 15 should connect these top and bottom copper layers and to the ground layer. These vias act as “heat pipes” to carry the thermal energy away from the device side of the board to where it can be more effectively dissipated.

**Figure 15. Recommended Land and Via Pattern**

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
LMK00105SQ/NOPB	ACTIVE	WQFN	RTW	24	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	K00105	<a href="#">Samples</a>
LMK00105SQE/NOPB	ACTIVE	WQFN	RTW	24	250	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	K00105	<a href="#">Samples</a>
LMK00105SQX/NOPB	ACTIVE	WQFN	RTW	24	4500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	K00105	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
